

SuperPOSS PRO
*provides meaningful
 information that is
 easily accessible for
 making key decisions
 and avoiding costly
 errors.*

Highly-developed information systems are necessary to survive in this era of knowledge-based business. SuperPOSS PRO is a full pricing, financial reporting and merchandise scan support system designed specifically for retail environments. Easy to use screens enable quick and easy access to all available functions. Steadily enhanced and upgraded for more than 20 years, SuperPOSS is a proven retail solution with abundant features.

SuperPOSS PRO supplies complete price management, movement tracking, vendor management, product listing and reporting capabilities. Features like these improve service and quality, cut costs, and make quick decisions easy by providing the information you need.

Sophisticated multi-user/multi-tasking allows you to work more efficiently. With SuperPOSS' features, you can easily input price changes, verify shelf information, and receive backdoor deliveries, all at the same time.

Different pricing methods include batch prioritization, lowest price wins, query capability as well as mass attribute changing.

SuperPOSS PRO's functionality and rich feature set run on a variety of industry standard operating platforms.

Operating Systems

Windows 98 SE
 Windows 2000
 Windows XP
 Windows NT
 Windows 2003 Server

Current Registers

Datasym
 IBM Ace
 ICL ISS45
 NCR 2127
 NCR ACS IR
 ScanMaster

The continued improvement and upgrading of the SuperPOSS system is an essential piece of MEISolutions' ongoing commitment to SuperPOSS users.

SuperPOSS PRO, MEISolutions' Windows-based backoffice software is the latest release of our time-tested backoffice software, SuperPOSS. The new version adds several new features that make SuperPOSS PRO faster and easier for new and experienced scan coordinators to use. Some of the added features include:

Grouping of similar SuperPOSS functions into Windows style drop-down menus.

Sub-screens with easier to follow logic.

Advanced maintenance feature to include query capability and mass attribute changes.

Batch prioritization capability as well as lowest price wins.

Screens and menus with interactive keyboard and mouse control providing the ease of point-and-click functionality.

All reporting options listed in a separate drop-down menu increasing the ease of reporting.

Date entries include a calendar menu to insure accurate creation of promotions, batches and other SuperPOSS PRO features that have start and end dates.

Enhanced security features allowing different user and manager control levels.

New drivers available for ODBC access of data.

Historical Financial Reporting.

Enhanced file integrity checking.

MEISolutions' DSD streamlines product flow from vendor to customer, reducing costs and providing a competitive advantage.

All retailers want to have more control over their store operations. With MEISolutions Direct Store Delivery working in your store, you'll receive and verify deliveries at your receiving work stations, and report on gross margin to better track profitability.

For example, you can verify an incoming retail price with your POS price and check vendor files for costs, discounts and authorized items. You can also compare receiving totals against vendor invoice totals instantly. You'll protect against unauthorized deliveries, as well as computational errors. Accuracy and consistency is maintained by transferring receiving details to your accounts payable system. On-line receiving lets you suspend one vendor to receive another.

MEISolutions' DSD and SuperPOSS PRO share the same database. This link to your front-end system lets you update the on-hand count in SuperPOSS PRO, giving you the power to track profitability of DSD items based on actual POS movement and maintain an accurate inventory. Through single file access and actual sales data from SuperPOSS PRO, DSD allows for both "going in" and "going out" gross margin reporting.

MEISolutions' DSD definitively closes the loop in inventory control, making it easier for the retailer to get ahead.

DSD

Features

- FM and keyboard receiving
- Extended vendor invoices
- Update on-hand inventory
- Suspend/Resume receiver(s)
- Control future costs
- Track current and future deals
- Generate retail price changes based on desired margin
- Transfer receiving detail to A/P
- Weekly recap
- Host support
- Item profitability
- Vendor recap reporting
- Print shelf tags through FM
- Automatically compute deposit changes

For more information call (509) 232-3177 or visit www.meisolutions.com

The power and speed of a computer, with the portability of a wireless FM Network: MEISolutions' PFM network is designed to make your information system work for you.

MEISolutions' PFM's extensive inventory management utilities allow you to perform a physical inventory and compare it to book, wall-to-wall inventories, or inventories divided by department and category. Ethernet and Serial communication modes are available. The PFM lets you use one or more portable entry terminals to perform shelf audits, make on-the-spot price changes, take inventory, perform PLU file maintenance and verify direct store deliveries.

The information collected can be immediately updated to the Point of Sale or held for later communications. While running the network, each portable entry terminal becomes, in effect, a remote computer terminal from which you can access certain SuperPOSS functions.

The PFM service runs in the background, leaving the computer free for:

| | |
|---------------------|---------------------|
| Price changes | Inventory reporting |
| Financial reporting | Movement reporting |

Multiple FM device types are supported, including:

| | |
|----------------------------|--------|
| Symbol | AML |
| Norand | Telxon |
| Dolphin HHP | Falcon |
| Wavelink Telnet CE over IP | |

PFM INTERFACE

Functions and Features

- Inventory status reporting
- PLU inventory
- PLU reorder
- Out of stock
- Security/designated user ability
- Item change through FM
- Apply maintenance from FM to POS
- Create promotional batches
- Modify PLU records
- Field data duplication by scanning
- Inventory recount report
- Audit statistics report
- PFM Status report
- Audit frequent buyer discounts
- FM Store opening/store verification
- Ordering system

REPORTING OPTIONS

Whether users are trying to find out what's selling or what's not, SuperPOSS PRO has a multitude of movement reports available. Movement reports are available daily, weekly, quarterly, periodic, plus by any date range specified by the user. Users can pull movement by department, category vendor or PLU range.

Gross profit reporting and Ad/Loss reports allow users to manage pricing more effectively and see how specific ads and sales performed.

A variety of inventory reports are available. These options include reorder, out of stock, on hand count, and actual inventory review and valuation reports.

Vendor reporting goes hand-in-hand with DSD reporting. Users can report on items delivered by a particular vendor, future discounts, allowances, and sales.

The custom report writer gives users the ability to create reports and save the format for future use.

ODBC drivers are available for more advanced users who wish to create their own reports in a third-party software program.

- Movement
- Gross Profit
- Inventory
- Ad/Loss
- Vendor
- Custom Report Writer
- DSD
- ODBC Drivers

With enhanced pricing capabilities, SuperPOSS can adapt to any users' preference.

PRICING CAPABILITIES

Simple Pricing methods offer users the ability to create immediate price changes or group changes into batches for application at a later date.

With the **Lowest Price Wins** (LPW) feature turned on, users can have an unlimited number of price changes in the system. The lowest price in the system for that day will be the price that is in effect.

Batching Priority allows POS coordinators to assign priority levels to their batches. At the time of application, these levels will be used to determine which price change takes affect. Similar to LPW, the logic is designed to prevent sale prices at a lower priority from overwriting a sale price of a higher priority. A scale of 1-5 is used to determine the importance of the batch, 1 being the highest priority and 5 being the lowest. If two batches with the same priority are active at the same time for a UPC, the lower price of the two batches will take precedence over the other.

Using **Advanced Maintenance** gives the ability to search for items, apply mass attribute changes, and create pricing templates.

Batching Priority

*MEISolutions
Customer
Service -
Dedicated to
Excellence,
Delivering
Expertise*

MEISolutions takes pride in a professional service staff that understands the needs of MEI customers and MEI products. The MEI support team possesses extensive experience in MEI's technology services.

MEI's Customer Support Department is committed to the highest standards of software service delivering premium application support and consulting expertise. Customers with current support agreements reap the benefits of:

- Maximum Customer Satisfaction
- Flexibility of Services
- Optimal Problem Resolutions
- Dedicated 800 Number
- Free Updates of Existing Software

With all software purchases, 90 days of warranty support is included. After the warranty period, support is provided by a three-year support contract. Support for the first year is prorated through the end of the calendar year. Thereafter, MEI will invoice software services annually.

Along with technical support, our staff is also qualified to train users on how to best use the system for their environment. We can do on-site training, training at our office, or training over the internet.

Our technical support team is the best in the business. Our company is located in Spokane, Washington, and all of our technical support is performed from our office.

In our annual customer service survey, we have a 98% approval rating!

The success of any enterprise is how it uses the data available.

SuperHost gives the ability to handle the data of several stores as if it were one store.

SuperHOST allows complete price management, movement tracking, and extensive listing and reporting capabilities from one location. Implementing SuperHOST at corporate headquarters will put control of the chain's pricing philosophy and inventory strategy in the hands of the corporate decision makers, ultimately improving profit margin.

SuperHOST employs Microsoft SQL Server as it's high performance database allowing for presentation of information in an easy to use spread-sheet style interface. This format also allows for searches, imports and exports, movement and so much more. Queries are user-defined and extremely flexible.

The Executive Information System in SuperHOST gives even the occasional user the power to drill down to the right amount of data for informed decision making. EIS also provides a unique and flexible way of analyzing movement, profitability, and finding errors.
